

## Overview

InfoLog™ 4.0 is a browser-based application used to electronically capture operator activity and track operator tasks.

With InfoLog, operators can record information about daily operations, view a prioritized task list, and access a dashboard that includes shift status and summary reports. Operators can easily access a historical knowledge base to make more informed decisions and keep the workplace running safely and efficiently. By storing information electronically, issues concerning accuracy, security, accessibility, and recording are minimized.

InfoLog helps identify key information to help operations run safely and efficiently. It can alert the responsible person/team when required tasks are incomplete. It can also document past observations on equipment or process issues and record how each was resolved.

The Event Monitor is an optional licensed component of InfoLog. It enables automatic creation of log entries based on OPC values or DeltaV Events.

## Features and Benefits

---

Browser-based data entry and collaboration

---

Intuitive user-friendly interface

---

Improve visibility and accuracy of log entries

---

Seamless collaboration between multiple roles and departments

---

Contextual information and comprehensive entries

---

Customized user dashboard

---

Minimize shift handover risk

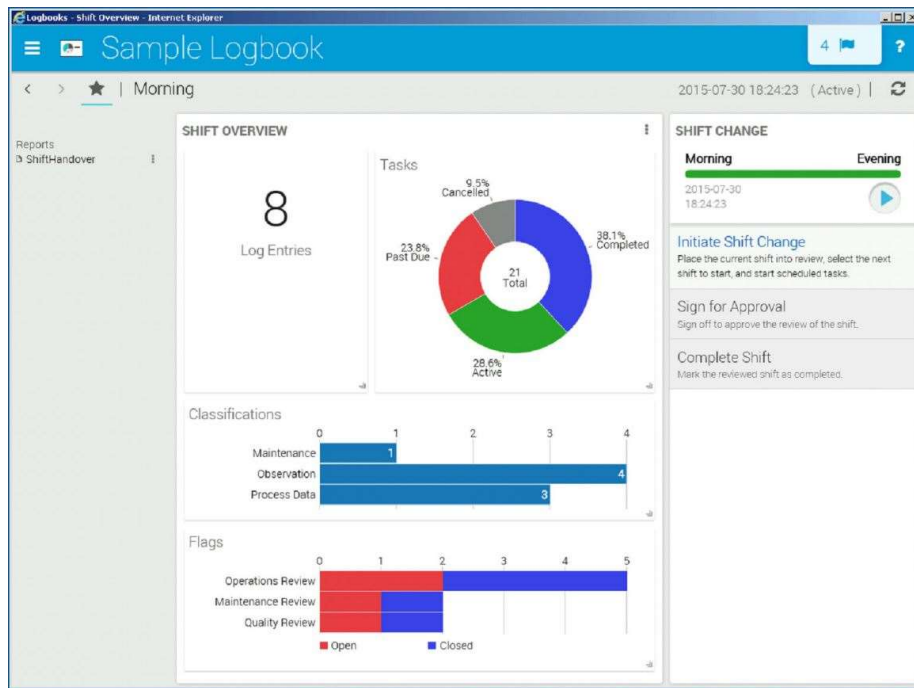

---

Role-based security model

---

Audit trail that allows for rigorous security and traceability

---

Shift transitions represent a critical moment, especially if there are issues ongoing. The InfoLog™ Shift View allows the incoming operations team to see issues and any pending tasks that are flagged for review to better manage the shift handover. During the shift, the team has a comprehensive view into activities and associated tasks.
